STAGE 01

Ideation Phase

Problem, users, value proposition, and product scope.

PROJECT	STACK	DOCUMENT
HotelPro	React • Vite • Express • MongoDB	Stage 1 of 7

Documentation note

Prepared from HotelPro project context shared earlier. Verify implementation details against the current repository. Historical test/build figures are marked as reported, not freshly verified.

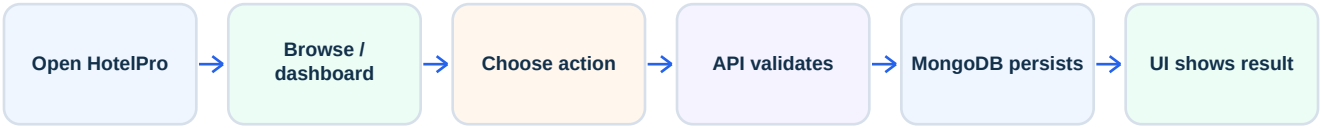
Problem statement

Hotel operations can become fragmented when rooms, reservations, payment-related records, and staff tasks are managed separately. HotelPro aims to centralize common hotel workflows in one web application.

Stakeholders

Stakeholder	Need	Value
Guest/customer	Understand rooms and booking status	Clearer booking journey
Admin	Manage inventory and operations	Centralized oversight
Staff	Perform permitted tasks	Role-aware workflow
Maintainer	Safely update code	Separated application layers

Product flow



Goals

Goal	Evidence	Priority
Reliable booking	Server checks dates and availability	High
Secure admin	Unauthorized API actions blocked	High
Maintainability	Clear route/model/component responsibilities	High
Usability	Forms provide helpful feedback	Medium

Risks

Risk	Impact	Mitigation
Booking conflicts	Incorrect room availability	Check availability at booking time
Leaked secrets	Security exposure	Ignore .env and use safe examples
Unverified features	Inaccurate claims	Compare docs with current code
