STAGE 05

Project Development Phase

Stack, feature evidence, local workflow, and safe engineering practices.

PROJECT	STACK	DOCUMENT
HotelPro	React • Vite • Express • MongoDB	Stage 5 of 7

Documentation note

Prepared from HotelPro project context shared earlier. Verify implementation details against the current repository. Historical test/build figures are marked as reported, not freshly verified.

Technology stack

Area	Technology	Purpose
Frontend	React + Vite	Browser UI
Backend	Node.js + Express	REST API/business logic
Database	MongoDB + Mongoose	Persistent data
Version control	Git/GitHub	Track changes

Feature evidence

Feature	Inspect	Verify
Authentication	Auth routes and user model	Valid/invalid login
Rooms	Room model/routes/screens	CRUD and role checks
Bookings	Booking model/availability rules	Valid booking and conflict
Payments	Related records if implemented	Association/failure states
Admin/staff	Role middleware and dashboard	Permission matrix

Local topology

Local run checklist

1. Install dependencies with project package scripts.
2. Start MongoDB.
3. Create Server/.env from a safe example.
4. Start backend from Server.
5. Start frontend from Client.
6. Test login and room/booking workflows.

Security checklist

Check	Practice
Secrets	Never commit real .env or tokens
Passwords	Store hashes, not plaintext
Authorization	Enforce role checks server-side
Validation	Validate IDs, dates, amounts, required fields
Errors	Do not expose stack traces/secrets
Git	Review diff and large/generated files

Reported status

Earlier project notes reported 63 passing tests across 8 suites and a successful frontend build. These are historical user-reported results, not rerun during this update. Verify using the current repository scripts.

Evidence log

Date/commit	Change	Command/evidence	Outcome
Add date	Feature/fix	Test/build/log/screenshot	Pass/fail
Add date	Feature/fix	Test/build/log/screenshot	Pass/fail
