STAGE 06

Performance Testing

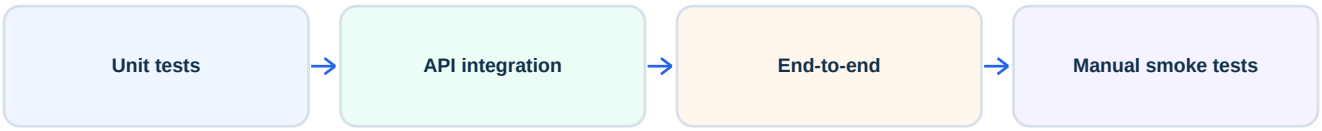
Test scenarios, repeatable execution, and performance measurement.

PROJECT	STACK	DOCUMENT
HotelPro	React • Vite • Express • MongoDB	Stage 6 of 7

Documentation note

Prepared from HotelPro project context shared earlier. Verify implementation details against the current repository. Historical test/build figures are marked as reported, not freshly verified.

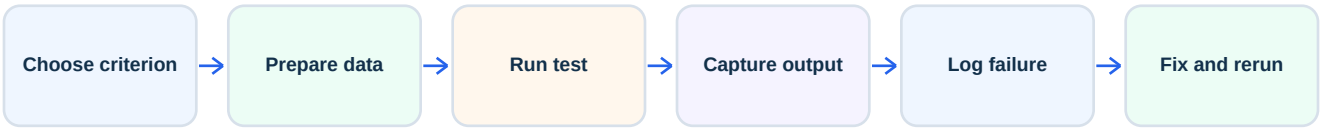
Test pyramid



Test cases

ID	Scenario	Expected result
AUTH-01	Valid credentials	Authentication succeeds safely
AUTH-02	Invalid credentials	Rejected without sensitive details
ROLE-01	Non-admin calls admin route	Forbidden response
ROOM-01	Create valid room	Record persists
ROOM-02	Invalid room data	Validation error
BOOK-01	Book available room	Booking created consistently
BOOK-02	Unavailable room/date overlap	Conflict handled by policy
API-01	Unknown endpoint	Consistent 404
UI-01	API offline	Recoverable error shown
BUILD-01	Clean client build	Build succeeds

Execution flow



Performance metrics

Metric	Method	Record
API latency	Repeated key endpoint calls	Median/p95 and environment
Throughput	Controlled load	Requests/sec and error rate
Database	Representative dataset	Size, indexes, query timing
Frontend	Browser performance tools	Load time/console errors
Reliability	Repeat workflows	Success rate/failure types

Results log

Run	Environment	Command/tool	Result	Evidence
T-001	Local + dataset size	Test command	Fill actual	Log
T-002	Clean build	npm run build if applicable	Fill actual	Output
T-003	API load	Tool and parameters	Fill actual	Report

Reported results

Earlier notes reported 63 passing tests across 8 suites and a successful frontend build. Not rerun here; record fresh commands, environment, date, and actual output.

Exit criteria

No critical unresolved defects; auth/roles pass; booking edge cases covered; test/build results reproducible; performance data includes environment and dataset size.
